Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).

Handwritten text in a cursive script, likely a letter or document. The text is written in dark ink on a light background. The handwriting is fluid and somewhat slanted. The text is arranged in several lines, with some lines being longer than others. The overall appearance is that of a handwritten document from the 18th or 19th century.

1. The first part of the paper is devoted to a discussion of the
 2. various methods of determining the rate of growth of a
 3. population. The methods are classified into two groups: direct
 4. and indirect. Direct methods are those in which the rate of
 5. growth is determined by counting the number of individuals
 6. in a population at two different times. Indirect methods are
 7. those in which the rate of growth is determined by measuring
 8. some other variable which is known to be related to the
 9. rate of growth. The indirect methods are further divided into
 10. two groups: those which are based on the measurement of
 11. the rate of change of a variable, and those which are based
 12. on the measurement of the variable itself. The direct methods
 13. are further divided into two groups: those which are based
 14. on the measurement of the number of individuals, and those
 15. which are based on the measurement of the rate of change of
 16. the number of individuals. The indirect methods are further
 17. divided into two groups: those which are based on the
 18. measurement of the rate of change of a variable, and those
 19. which are based on the measurement of the variable itself.

20. The second part of the paper is devoted to a discussion of
 21. the various factors which influence the rate of growth of a
 22. population. The factors are classified into two groups: internal
 23. and external. Internal factors are those which are determined
 24. by the characteristics of the population itself. External factors
 25. are those which are determined by the environment. The internal
 26. factors are further divided into two groups: those which are
 27. determined by the genetic characteristics of the population, and
 28. those which are determined by the physiological characteristics
 29. of the population. The external factors are further divided
 30. into two groups: those which are determined by the physical
 31. environment, and those which are determined by the social
 32. environment.
